The DDX4 FISH probe is designed to hybridize to the DDX4 gene on 5q11.2 and is primarily used for detecting amplifications and deletions associated with the gene. This probe is FISH confirmed on normal peripheral blood metaphase spreads and interphase nuclei. The probe can be labeled in one of five colors, using standard Nick Translation protocols. Each probe is sold in a 20 test kit (approximately 20 slides - 22x22 mm area) and includes hybridization buffer. ASR and CE marked probes are available upon request. Please also note that due to design optimizations, prices are subject to change.
